GUI.PY

EXECUTEPROGRAM.PY

MAIN.PY

purpose of the class, purpose of each function, description of any input parameters for the function, description of return value (if any), pre- and post-conditions for the function

Brandon Woodruff

UVSIM.PY

GUI class
Function: creates a simple GUI using tkinter
Input: UVsim class
Methods:
 select_file():
    purpose: search directories and choose a txt file.
    input: n/a
load_file():
    purpose: load program from the user-selected file into the sim
    input: n/a
operations_output():
    purpose: output accumulator value in GUI.
    input: machine language command, function's name, and the operand.
final_output():
    purpose:output accumulator value in GUI.
    input: n/a
read():
    purpose: Read a word from the keyboard into memory.
    input: value from keyboard
submit():
    purpose: command for GUI button, causes GUI to proceed
    input: n/a
write():
    purpose: write a word from memory to gui
    input: n/a
too_long():
    purpose: GUI error message if sim pc exceeds available memory
    input: n/a

Brandon Woodruff

SIMPLEGUI CLASS

-main: GUI window
-sim: object
-label: object
-file_button: object
-operations_text: object
-_program: list

select_file()

load_file()

operations_output()

final_output()

read()

submit()

write()

too_long()

MAIN

my_Sim = UVSim(100)

my_gui = SimpleGUI(my_sim)

my_gui.main.mainloop()

Main:
Function: to run the code
Input: Program: n/a
Methods: n/a

Brandon Woodruff

EXECUTE CLASS

execute_program()

execute_program class
Function: to execute the program
Input: UVSim class
Methods:
  execute():
    purpose: To actually execute, To call the other classes as needed.
    input: GUI

Brandon Woodruff

UVSIM CLASS

-_memory: int
-_accumulator: int
-_pc: int
-_operand: int
-_op: int
-_program: list

Constructor()

load_ml_program()

load()

store()

add()

subtract()

divide()

multiply()

branch()

branch_neg()

branch_zero()

halt()

UVSim class
Function: UVSim is a simulation that can interpret a machine language called BasicML.
Input:n/a
Methods:

load_ml_program:
    function: to load the program into memory.
    input: a program list
  load:
    function: to get the value of a memory from a specific location
    input: a value for the location
  store:
    function: to store a value into a specific location in memory
    input: a value for the location, and the value to store there.
add:
    function: to add two numbers
    input: two values to add together
subtract:
    function: to subtract two numbers
    input: two values to subtract
divide:
    function: to divide a number from another
    input: a value, and a value to divide that number by
multiply:
    function: to multiply two numbers
    input: two values to multiply
branch:
    function: to move to a specific location in memory
    input: a value
  branchNeg:
    function: to move to a specific location if the number is negative.
    input: accumulator value, operand value, and pc value
  branchZero:
    function: to move to a specific location if the number is negative
    input:
  halt:
    function: to end the program immediately
    input: n/a
